Bootstrap

Prof. Manan Thakkar

Bootstrap Container

- In Bootstrap, container is used to set the content's margins dealing with the responsive behaviors of your layout. It contains the row elements and the row elements are the container of columns (known as grid system).

- The **container class** is used to create boxed content.

- There are two container classes in Bootstrap:

   1. container

   2. container-fluid

container

- .container, which sets a max-width at each responsive breakpoint

	Extra small <576px	Small ≥576px	Medium ≥768px	Large ≥992px	Extra large ≥1200px
max-width	100%	540px	720px	960px	1140px

container-fluid

- .container-fluid, which is width: 100% at all breakpoints
